TASK: FULL STACK

OBJECTIVE:

This task encompasses the creation of a "to-do" app using JavaScript, Next.js, TypeScript, Redux Toolkit, Material-UI, Nodejs, NestJs. The goal is to demonstrate proficiency in setting up a development environment, implementing user authentication pages, and integrating "to-do" functionality into the app.

Figma design: https://www.figma.com/file/OF54sm1b5738keMZtfDV89/Todo-List-UI?type=design&node-id=1-2&mode=design&t=S45qUUPr644lMaDp-0

PART 1: ENVIRONMENT SETUP AND INITIAL COMMIT

1. Set up the development environment.
2. Generate a boilerplate for the application both frontend and backend
3. Push the initial codebase to a newly created GitHub repository.

PART 2: USER (BACKEND)

CREATE AN AUTH SYSTEM.

1. SIGNUP FLOW:
    i. User signup
    ii. OTP send to the user's email.
    iii. User verify the otp.

2. LOGIN FLOW:
    i. User enter his credentials and get access token along user's details.

3. FORGOT PASSWORD FLOW:
    i. User enter his email, send the otp to user's email.
    ii. User enter otp, if otp is correct then allow him to change the password.

4. DEVELOP TODO CURD SYSTEM.

PART 3: USER AUTHENTICATION PAGES (FRONTEND)

1. Develop signup, login and forgot password pages. (you can use model instead of page for auth)
2. Allow only the verified user. Like check the user credentials exist and also check that the user verified his otp or not. If not then ask him to enter his otp for verification.
3. Implement user authentication functionalities.
4. Commit and push the changes to the GitHub repository.

PART 4: TO-DO FUNCTIONALITY INTEGRATION

1. Develop "to-do" functionality within the app using data from https://dummyjson.com/docs/.
2. Ensure CRUD (Create, Read, Update, Delete) operations for to-dos.
3. Commit the changes and push to the GitHub repository.

EVALUATION CRITERIA:

1. Each part is functional and adheres to the requirements above.
2. Effective usage of JavaScript, Next.js, TypeScript, Redux Toolkit, Material-UI, Nodejs, ExpressJs.

NOTE: PLEASE PROVIDE THE FOLLOWING LINKS.

1. Frontend and backend github link
2. Frontend and backend vercel or any live link.

Upon completion: Please submit above mentioned link for evaluation. The repository should contain the complete application as outlined above.
